USER EXPERIENCE

PROMPT 3: SCROLL DYNAMICS

Interaction Philosophy

Add immersive and cinematic scroll animations throughout the portfolio to create a fluid, high-end interactive experience. Every motion should feel deliberate and weighted.

- **Hero Section Parallax:** As the user scrolls, the hero background and 3D geometric canvas should subtly move with parallax depth, giving a sense of layered spatial motion. Headline and buttons should appear with smooth fade-in and scale-up animations using soft cubic-bezier easing. Apply a slight motion delay and natural stagger for text and CTA buttons.
- **Section Reveals:** Each portfolio section should animate into view as it enters the viewport—use a combination of fade, slide, and monochrome masked reveal transitions. Headings should smoothly rise or unmask from below with subtle silver glow highlights. Content cards and images should appear with staggered entrance timing and soft motion blur for cinematic depth.
- **Scroll-Linked Motion:** Link key animations (background movement, light flow, and element reveals) to scroll progress for precise timing and fluid transitions. Add depth by animating background gradients, glowing white elements, or particles at different scroll speeds.
- **Interactive Details:** Add hover and focus effects with soft grey glow pulses or brightness shifts on interactive elements like buttons or icons. Subtly reactive lighting on text and elements as they appear on scroll will enhance immersion.

Performance & Feel

The entire site should feel dynamic, architectural, and seamless—every scroll should trigger meaningful motion and reveal new monochromatic layers of the design. Keep animations perfectly smooth (60fps target), performance-optimized (GPU accelerated), and consistent across desktop and mobile devices.
