COMPONENT INTERACTIONS

PROMPT 4: 3D HOVER DEPTH

Hover Architecture

Add an advanced 3D interactive hover effect to the main portfolio item cards in the selected works section. When the user moves their mouse over the card, it should act as a physical window into a digital space.

- The card should tilt and rotate smoothly in 3D space based on the exact X and Y cursor position, creating a highly realistic depth illusion.
- Add soft parallax motion inside the card: background greyscale gradients, vector icons, or text layers should slightly move at different speeds (Z-axis translation) to enhance the 3D depth separation.
- Apply a dynamic white/silver glow or reflection highlight that moves across the glassmorphic surface as the card tilts, simulating a stark overhead light reflection or holographic sheen.
- Include a subtle overall scale-up (lift) and soft shadow expansion (drop shadow diffusing further) for a tactile sense of elevation.
- When the cursor leaves the bounding box, the card must ease back to its resting state with smooth, spring-based physics motion (no harsh snapping).

Physics Parameters

Maximum Tilt Angle	± 12 degrees (X and Y axis)
Parallax Layer Offset	Foreground: +20px, Background: -10px
Glare Highlight	Radial Gradient (White to Transparent, 40% Opacity)
Resting Easing (Mouse Leave)	Spring physics (mass: 1, stiffness: 100, damping: 15)
